TEST REPORT
UL 2056:2024 R2.25
STANDARD FOR SAFETY Portable Chargers

Report Number..... : RHDTL260327062
Date of issue..... : 2026.04.15
Total number of pages..... : 36 pages
Applicant's name..... : QUANZHOU LIANSAI CO.,LTD
Address..... : Room 704, Step 2, Building 1, Xingsheng, No.42, Maluhuan Lane, Huixing Street, Luocheng Town, Hui 'an County, Quanzhou City, Fujian Province
Manufacturer..... : Guangdong Cvasun New Energy Technology Co., Ltd
Address..... : ShiChongheng Road, Shipai Town, Dongguan City, Guangdong Province
Trade Mark..... : N/A
Test item description..... : Power Bank
Model/Type reference..... : W8 Pro
Ratings..... : 3.7V,6800mAh,25.16Wh
Test specification:
Standard..... : UL 2056:2024 R2.25
Test procedure..... : Test report
Responsible Testing Laboratory (as applicable), testing procedure and testing location(s):
Testing Laboratory..... : Dongguan HDTL Technology Co., Ltd.
Testing location/ address..... : Room 101, Building 1, No. 5 of Jinzhong Road, Dongcheng Street, Dongguan City, Guangdong Province, China.
Tested by (name + signature)..... : QiaoLi Chen *QiaoLi Chen*
Tested by (name, function, signature)..... : Brian Liu *Brian Liu*
Approved by (name, function, signature)..... : Chris zhao *Chris zhao*

Test item particulars:	
Information about the product needed to establish a correct test program, such as product mobility, type of power connections and similar.	(Test item particulars are selected by the TRF Originator base on the requirements in the standard)
Designation	Power Bank
Trademark	/
Input rating	Input (Lightning Port) : 5V \equiv 3A,9V \equiv 2.22A(PD20W) Input (TvDe-C Port) :5V \equiv 3A,9V \equiv 2.22A,12V \equiv 1.67A(PD20w) Output (Type-C Cable):5V \equiv 3.1A Output (Lightning Cable) : 5V \equiv 3.1A
Output rating	Output (Wireless charging):7.5W,10W,15W(15W Max) Output(Type-C Port) : 5V \equiv 3A,9V \equiv 3A,12V \equiv 2A,15V \equiv 2A,20V \equiv 1.5A (PD30W)
Built-in battery rated capacity	3.7V,6800mAh,25.16Wh
Output capacity	4080mAh(5V \equiv 3A)
Discharge cutoff voltage	3V
Output capacity	60%
Ambient temperature range	0~45°C (charge), -10~60°C (discharge)
Manufacturer's charge method	Charging the power bank with 5V \equiv 3A, until charge current is 136mA.
Manufacturer's discharge method.	Discharge the power bank with 5V \equiv 3A, until 0% is off.
Sample number	B01~B36
Possible test case verdicts:	
Test case does not apply to the test object	N(/A)
Test object does meet the requirement	P(ass)
Test object does not meet the requirement	F(ail)
Testing:	
Date of receipt of test item	2026.03.27
Date(s) of performance of tests	2026.03.27 ~ 2026.04.15
General remarks:	
This report shall not be reproduced, except in full, without the written approval of the testing laboratory.	
The test results presented in this report relate only to the object tested.	
"(see remark #)" refers to a remark appended to the report.	
"(see appended table)" refers to a table appended to the report.	
Throughout this report a point is used as the decimal separator.	

Test clauses and results:

Copy of marking plate:

POWER BANK

Model NO:W8 Pro Capacity:6800mAh 25.16Wh/3.7V

Output (Type-C Cable): 5V/3.1A

Output (Lightning Cable) : 5V/3.1A

Output (Wireless charging) : 7.5W,10W,15W(15W Max)

Output(Type-C Port) : 5V/3A,9V/3A,12V/2A,15V/2A,20V/1.5A (PD30W)

Input (Lightning Port) : 5V/3A,9V/2.22A(PD20W)

Input (Type-C Port) : 5V/3A,9V/2.22A,12V/1.67A(PD20W)

Size:107*66*17mm     Made in China

General product information and other remarks:

The product covered in this report is a Portable Charger which is intended to use for mobile powering of low voltage electronic devices.

This Portable Charger is constructed with 1 cell (1S1P) and has overcharge, over-discharge, over current and short-circuits proof circuit.

The Portable Charger mainly composed of:

- Protective circuit module
- Li-ion cell (1S1P)
- Wiring
- Plastic enclosure

Portable Charger electrical parameter:

Item	Component cell (for reference)	Portable Charger
Model	955565	W8 Pro
Rated capacity	6800mAh	4080mAh
Nominal voltage	3.7V	5V
Nominal charging current	5A	3.0A
Nominal discharging current	5A	3.0A
Maximum charging current	5A	3.0A
Maximum discharging current	5A	3.1A
Upper limit charging voltage	4.2V	5.2V
End-of-discharge voltage	3.0V	--
Charge temperature range	0~45°C	0~45°C

Construction:

1. LED light 2. Lightning input 3. Type-C input/output
 4. Power button 5. Folding stand 6. Wireless charging indicator
 7. Power indicator 8. Type-C built-in cable
 9. Lightning built-in cable 10. Wireless charging area
 Long press the button to turn on the light, and long press the button again to turn off the light.

UL 2056:2025			
Clause	Requirement + Test	Result - Remark	Verdict
CONSTRUCTION			
6	General		P
6.1	Casing and enclosure		P
6.1.1	The enclosure of a Portable Charger shall have the strength and rigidity required to resist the reasonably foreseeable abuses, that it is exposed to during its reasonably foreseeable use, in order to reduce the risk of fire or injury to persons.		P
6.1.2	The enclosure of a Portable Charger shall be rigid enough to prevent flexing that would result in damage to the cells or internal protective components. A tool providing the mechanical advantage of a plier, hacksaw, or similar tool, shall be the minimum mechanical capability required to open the Portable Charger enclosure.	Complied.	P
6.1.3	For a Portable Charger with a plastic outer enclosure, the outer enclosure shall be designed such that it is not capable of being opened using simple tools, such as a screwdriver. The enclosure shall be ultrasonically welded, or permanently secured by equivalent means. Adhesives complying with the adhesive requirements of UL 746C or CSA C22.2 No. 0.17, single use or tamper-proof screws are considered equivalent means.		N/A
6.1.4	All outer enclosure material of the Portable Charger shall be classed as V-1 or less flammable (e.g. V-0, 5VB, 5VA) with its RTI temperature ratings in the minimum part thickness in accordance with UL 94 or CSA C22.2 No. 0.17. Enclosure material without suitable RTI temperature ratings but passing the glowwire test at 550 °C (1022 °F) according to IEC 60695-2-11 is acceptable as an alternative.		P
Exception	Materials are not required to be classed as V-1 or less flammable when they comply with the Enclosure Flammability – 20 mm (3/4 inch) Flame test described in UL 746C or CSA C22.2 No. 0.17.		P
6.1.5	Nonmetallic materials used for internal parts within the overall enclosure shall be rated V-2 minimum (e.g. V-2, V-1, V-0, 5VB, 5VA).		P
6.1.6	Small parts, and gaskets, that are not located near live parts, and are located in a manner such that they cannot propagate flame from one area to another within the equipment, are not required to have a specific flame rating.		P

UL 2056:2025			
Clause	Requirement + Test	Result - Remark	Verdict
6.1.7	No openings in Portable Charger enclosures shall be permitted to prevent damage to cells, connections, and internal circuitry and shorting of electrical spacings within the pack.		P
Exception	Openings for power input/output and pressure venting are permitted. Enclosure openings are permitted to be located over cells that comply with the rigid casing requirements of 6.1.2 or over protective circuitry and connections where damage or shorting from debris entering the enclosure shall not result in a hazard.		P
6.2	Cells		
6.2.1	The lithium cell of a Portable Charger shall comply with either UL 1642 or UL 62133-2 / CSA C22.2 No. 62133-2.		P
6.2.2	The nickel cell of a Portable Charger shall comply with either UL 2054 or UL 62133-1 / CSA C22.2 No. 62133-1.		N/A
6.2.3	For other chemistry of cell types, the cell shall comply with the related safety standard requirements.		P
6.3	Wiring and terminals		P
6.3.1	Wiring shall be insulated and acceptable for the purpose, when considered with respect to temperature, current, and voltage to which the wiring is likely to be subjected within the Portable Charger .	Complied.	P
6.3.2	All wiring connections shall be mechanically secured and shall provide electrical contact without strain on connections and terminals. Wiring shall be secured and routed away from sharp edges or other parts that may compromise wiring insulation.		P
6.3.3	Wiring splices and twist connectors shall not be permitted for Portable Charger s.		P
6.3.4	All electrical connections, such as splicing wire connectors, quick-connect terminals, terminal connectors, multi-pin and other forms of wire connectors, shall comply with the following standards: a) UL 310 / CSA C22.2 No. 153; b) UL 486A-486B / CSA C22.2 No. 65; c) UL 486C / CSA C22.2 No. 188;	Complied.	P

UL 2056:2025			
Clause	Requirement + Test	Result - Remark	Verdict
	d) UL 486E or CSA C22.2 No. 158 or CSA C22.2 No. 65; e) UL 1977 or CSA C22.2 No. 182.3.		
Exception	This requirement is not applicable to the following types of connections: a) Brazed or welded connections; b) Soldered connections on printed circuit boards; or c) Connections on small components that are mounted on printed circuit boards located in a low-voltage circuit.		P
6.4	External Portable Charger connectors		P
6.4.1	An external Portable Charger connector shall be constructed to prevent inadvertent short circuiting of its terminals. Examples of methods to prevent inadvertent short-circuiting include recessing the terminals, providing circuitry that prevents inadvertent short circuiting, providing covers over the terminals, use of keyed connectors, and the like.		P
6.4.2	Insulating material for external Portable Charger connectors, outside the enclosure, shall have a V-2 minimum flame rating. External connectors forming part of the fire enclosure shall be V-1 minimum.		P
6.5	Printed wiring boards		P
6.5.1	Printed wiring boards with or without mounting circuit components shall be rated V-1 minimum and comply with UL 796.		P
6.6	Lithium ion systems only		P
6.6.1	The voltage and temperature of each cell or each cellblock consisting of parallel-connected plural cells shall not exceed the upper limit charging voltage and temperature specified by the cell manufacturer.		N/A
6.6.2	For the Portable Charger consisting of a single cell or a single cellblock, it shall be confirmed that the charging voltage and temperature of the cell does not exceed the upper limit charging voltage and temperature specified by the cell manufacturer.		P
6.6.3	For the Portable Charger consisting of series-connected plural single cells or series-connected plural cellblocks, it shall be confirmed that the voltages and temperatures of any one of the single cells or single cellblocks do not exceed the upper limit		N/A

UL 2056:2025			
Clause	Requirement + Test	Result - Remark	Verdict
	charging voltage and temperature, specified by the cell manufacturer, by monitoring the voltage and temperature of every single cell or the single cellblocks.		
6.6.4	Compliance for 6.6.1 – 6.6.3 can be achieved through analysis of the battery protection circuit or if unable to determine through analysis, then through monitoring values during the test of Sections 14 and 16.		P
6.7	Direct plug-in construction		N/A
6.7.1	<p>For Portable Charger s with direct plug-in construction, the following shall be met:</p> <p>a) The Portable Charger and its built-in ac/dc power supply shall comply with the applicable requirements of UL 62368-1 / CSA C22.2 No. 62368-1.</p> <p>b) A barrier shall be provided between the built-in ac/dc power supply and built-in battery pack. The barrier shall comply with the requirements of electrical insulation and fire enclosure of UL 62368-1 / CSA C22.2 No. 62368-1.</p> <p>c) When the Portable Charger is charged by an ac power source, the Portable Charger shall not discharge.</p>		N/A
6.8	Direct plug-in construction		N/A
6.8.1	The Portable Charger that provides wireless charging or wireless discharging functions shall comply with the applicable requirements of UL 2738 or similar.		N/A
PERFORMANCE			
7	General		P
7.1	Portable Charger s are to be tested as described in Sections 12 – 26. The Forced-Discharge Test, Section 15, is applicable only to Portable Charger s with cells in multicell series applications.		P
7.2	Portable Charger s or their cells shall not explode or catch fire as a result of the tests in this Standard. For the Steady Uniform Force Test, Section 22, and the Drop Impact Test, Section 25, the samples shall also not separate. For the Steady Uniform Force Test, Section 22, Flexing Force Test, Section 23, Mold Stress Relief Test, Section 24, and the Drop Impact Test, Section 25, the samples shall also not vent or leak. For these tests, unacceptable leakage is deemed to have occurred when the resulting mass		P

UL 2056:2025			
Clause	Requirement + Test	Result - Remark	Verdict
	loss exceeds 0.1 %.		
7.3	Each output port shall be an ES1 energy source in accordance with UL 62368-1 / CSA C22.2 No.62368-1.		N/A
7.4	Unless indicated otherwise, the Portable Charger s are to be tested in an ambient temperature of 20 ±5 °C (68 ±9 °F).		
8	Protective Devices		P
8.1	<p>When a current-limiting component or temperature-limiting component that has been evaluated for the purpose (i.e. a positive temperature coefficient device complying with the tests specified in UL 1434 and UL 60730-1 or CSA C22.2 E60730-1, the Annex for Requirements for Thermistor Elements and Controls Using Thermistors, Annex J) activates as designed, testing shall be resumed as follows:</p> <p>a) A resettable device that operates during the test – The test is to be continued allowing the device to cycle during the test;</p> <p>b) A non-resettable device or resettable device that operates during the test but does not reset – The test is to be repeated with the battery pack connected to the maximum load that does not cause the protective device to trip; and</p> <p>c) A current-limiting or temperature-limiting device that has not been evaluated for the purpose is to be shorted from the circuit prior to testing.</p>		P
9	Samples		P
9.1	Unless otherwise indicated, Portable Charger s in the fully charged state are to be used for the tests. The test program and number of samples to be used in each test is shown in Table 9.1.		P
9.2	All Portable Charger s shall be fully charged in accordance with the manufacturer's specifications prior to testing except for the samples to be subjected to the Abnormal Charging and Abusive Overcharge Tests, which shall be discharged to the manufacturer specified end-of-discharge voltage using the manufacturer specified current prior to testing.		N/A
10	Important test considerations		P
10.1	As some Portable Charger s explode in the tests, it is important that personnel be protected from the flying fragments, explosive force, sudden release of heat, chemical burns, and noise results from such explosions. The test area is to be well ventilated to		P

UL 2056:2025			
Clause	Requirement + Test	Result - Remark	Verdict
	protect personnel from possible harmful fumes or gases.		
10.2	The temperatures on the surface of the cell casings shall be monitored during the tests described in Sections 12, 13, 14, 15, 16 and 18. All personnel involved in the testing of Portable Charger s are to be instructed never to approach a sample until the surface temperature returns to ambient temperature.		P
11	Temperature measurements		P
11.1	Temperatures are to be measured by thermocouples consisting of wires not larger than 0.21 mm ² (24 AWG) and not smaller than 0.05 mm ² (30 AWG) and a potentiometer-type instrument.	Suitable thermocouples used during the test.	P
11.2	The temperature measurements on the Portable Charger are to be made with the measuring junction of the thermocouple held tightly against the outer enclosure of the Portable Charger .	Fulfilled.	P
ELECTRICAL TESTS			
12	Short-Circuit of Output Port Test		P
12.1	Each fully charged test sample Portable Charger , in turn, is to be short-circuited by connecting the positive and negative output port terminals of the Portable Charger with a circuit load having a resistance load of 80 ±20 mΩ. The temperature of the internal cell casing is to be monitored during the test. The Portable Charger is to discharge until a fire or explosion is obtained, or until it is completely discharged and/or the cell case temperature has returned to ±5 °C (±9 °F) of ambient temperature.		P
12.2	Tests are to be conducted at ambient temperatures of 20 ±5 °C (68 ±9 °F) and at 55 ±5 °C (131±9 °F). The Portable Charger s are to reach equilibrium at 20 ±5 °C (68 ±9 °F) or 55 ±5 °C (131 ±9 °F), as applicable, before the terminals output are connected.		N/A
12.3	Portable Charger constructions are to be subjected to a single fault across any protective device in the load circuit of the Portable Charger under test. When protective devices actuate during the test, the test shall be repeated with the Portable Charger connected to the maximum load that does not cause the protective devices to open. See 5.26.		P
Exception	A positive temperature coefficient device which complies with the tests specified in UL 1434, CSA C22.2 E60730-1 or UL 60730-1, or other protective devices determined to be reliable, may remain in the circuit without being faulted. See 5.26. Other standards that		N/A

UL 2056:2025			
Clause	Requirement + Test	Result - Remark	Verdict
	may apply are UL 248-14 / CSA C22.2 No. 248.14 and UL 60691 or CSA C22.2 No. 60691.		
12.4	One of the five test sample Portable Charger s, tested at ambient temperature of $20 \pm 5 \text{ }^\circ\text{C}$ ($68 \pm 9 \text{ }^\circ\text{F}$) shall be evaluated with the following additional conditions in place. The output terminals are to be subjected to a resistive circuit load and shall have a maximum total resistance of 20 m Ω . The test is to be conducted on a tissue paper covered soft wood surface and the sample Portable Charger and bare conductor are to be covered with a single layer of cheesecloth.		N/A
12.5	For Portable Charger s which enable their output(s) while the input power is applied, one of the test sample Portable Charger s apply the process as in 12.4 with the following additional conditions in place. The input terminals are to be subjected to the maximum charging rate and the output terminals are to be subjected to a resistive circuit load shall have a maximum total resistance of 20 m Ω at the same time. The test is to be conducted on a tissue paper covered soft wood surface and the sample Portable Charger and bare conductor are to be covered with a single layer of cheesecloth.		N/A
12.6	For lithium chemistries, one of the test sample Portable Charger s, tested at ambient temperature of $20 \pm 5 \text{ }^\circ\text{C}$ ($68 \pm 9 \text{ }^\circ\text{F}$) shall be evaluated with the following additional conditions in place. The built-in battery is to be discharged at an initial current of 1.2 times of the maximum continuous discharge current of the built-in battery. No need to apply the single fault condition on the built-in battery's BMS. The temperature of the cell casing and the discharge current of the cell shall be monitored. The discharge is to continue until the cell or battery explodes, vents, or BMS operates, and the temperature of the internal cell casing reaches steady state conditions or returns to ambient. The test is to be conducted at the output point of the protecting circuit that accompanies the built-in battery. This means output converter circuitry of the Portable Charger is to be bypassed to result in the evaluation of the protective circuitry for the battery.		P
12.7	For all samples tested, the samples shall not vent, explode, or catch fire and the tests shall not result in chemical leaks caused by cracking, rupturing or bursting of the cell casing. The temperature of the cell casings shall not exceed $75 \pm 1 \text{ }^\circ\text{C}$ ($167 \pm 2 \text{ }^\circ\text{F}$) for lithium chemistries. For Portable Charger samples tested in accordance with 12.4, there shall be no charring or burning of the cheesecloth or tissue paper. Charring is defined as a blackening of the cheesecloth caused by combustion. Discoloration of the cheesecloth caused by smoke is acceptable. For the sample tested by 12.6, the cell's discharge current shall be no greater than its maximum continuous discharge current of the operation region.		P

UL 2056:2025			
Clause	Requirement + Test	Result - Remark	Verdict
13	Abnormal Charging of the Battery Test		P
13.1	The Portable Charger s are to be tested in an ambient temperature of $20 \pm 5 \text{ }^\circ\text{C}$ ($68 \pm 9 \text{ }^\circ\text{F}$). A thermocouple is to be attached to the cells of each test sample Portable Charger . Each Portable Charger shall be discharged at a constant current of 0.2C/1 h, to a manufacturer specified end-of-discharge voltage of the built-in battery.		P
13.2	For lithium chemistries, one of the above five test samples in 13.1 shall be evaluated with the following additional conditions. The input voltage converter circuitry of the Portable Charger is to be bypassed to result in evaluation of the lower limit discharge voltage protective circuitry for the built-in battery. The builtin battery is to be discharged at a constant current of 0.2C/1 h, to 10 % deeper than the manufacturer specified end-of-discharge voltage. No need to apply the single fault condition on the battery BMS. The temperature of the cell casing and the voltage of the cell shall be monitored. The discharge is to continue until the cell or battery explodes, vents, or BMS operates, and the temperature of the internal cell casing reaches steady state conditions or returns to ambient.		P
13.3	Each test sample Portable Charger is to be subjected to the following abnormal charging conditions, in sequential order. a) The test is to be conducted at the input point of the protecting circuit that accompanies the built-in battery. This means input voltage converter circuitry of the Portable Charger is to be bypassed to result in evaluation of the protective circuitry for the battery. b) The built-in battery is to be initially charged at the input point (a) using a constant current charging mode with an abnormal charging current limit of three times the built-in battery's maximum current specified by the manufacturer until the maximum specified abnormal charging voltage is reached. At that point, the built-in battery is to be charged with a constant maximum specified abnormal charging voltage of the built-in battery and an abnormal charging current limit of three times the battery maximum current. Charging duration is the time required to reach the manufacturer's specified end-of-charge conditions (voltage and current) plus seven additional hours. The temperature on the cell casing shall be monitored. A re-settable protective device such as a PTC that actuates during the test shall be allowed to reset and the test shall be resumed, cycling as often as necessary, but no less than 10 times, to complete the test. Automatic reset devices are allowed to cycle during the test. When an overcurrent protective device operates during the test, the test is repeated with the same charging time, but with the battery connected to the maximum source that does not cause		P

UL 2056:2025			
Clause	Requirement + Test	Result - Remark	Verdict
	the protective devices to operate. NOTE: The current of three times the maximum current I_c calculation is based on the maximum current of built-in battery, not the maximum current of Portable Charger . c) The charge condition in accordance with (b) shall be conducted with each single component fault that is likely to occur in the battery protection circuit and which would result in overcharging of the built-in battery.		
Exception	A protective device determined to be reliable may remain in the circuit without being faulted. See 8.1 and 5.26.		N/A
13.4	For lithium chemistries, one of the test samples in 13.3 shall be evaluated with the following additional conditions in place. The built-in battery is to be initially charged at the input point in 13.3(a) using a constant current charging mode with an abnormal charging current of 20 % greater than the built-in battery's maximum current, specified by the manufacturer until the built-in battery's maximum specified charging voltage is reached. No need to apply the single fault condition on the battery BMS. The temperature of the cell casing and the charging current for the built-in battery shall be monitored. The test is to continue until the cell or battery explodes, vents, or BMS operates, and the temperature of the internal cell casing reaches steady state conditions or returns to ambient.		N/A
13.5	During the test, the temperature of the cell casings shall not exceed $90 \pm 1 \text{ }^\circ\text{C}$ ($194 \pm 2 \text{ }^\circ\text{F}$) for lithium chemistries.	See the test table for details	P
13.6	The samples shall not vent, explode, or catch fire. For Portable Charger samples, tests shall not result in chemical leaks caused by cracking, rupturing or bursting of the cell casing. For the sample tested in accordance with 13.2, the voltage of the cell shall not be lower than its end-of-discharge voltage of the operation region. For the sample tested in accordance with 13.4, the charging current of the cell shall not exceed its maximum charging current of the operation region.	The sample did not leak, explode, or catch fire.	P
14	Abusive Overcharge of the Battery Test		P
14.1	The Portable Charger s are to be tested in an ambient temperature of $20 \pm 5 \text{ }^\circ\text{C}$ ($68 \pm 9 \text{ }^\circ\text{F}$).		P
14.2	The tests are to be conducted at the input point of the protecting circuit that accompanies the built-in battery. This means input voltage converter circuitry of the Portable Charger is to be bypassed to evaluate the protection circuit for the built-in battery.		P

UL 2056:2025			
Clause	Requirement + Test	Result - Remark	Verdict
14.3	The built-in batteries are to be subjected to a constant charging current at the input point of 14.2 at 10 times the C5 amp rate, using a supply voltage sufficient to maintain the 10 times C5 amp rate throughout the duration of the test. During the test, the temperature is to be measured on the internal cell casing of each sample. The test is to continue until the cell or battery explodes, vents, or a single operation protective device operates, and the temperature of the internal cell casing reaches steady state conditions or returns to ambient. If a PTC or other re-settable protection device operates during the test, it is to be reset a minimum of 10 times during the test. An automatic reset device is allowed to cycle during the test.		P
14.4	The charge condition in accordance with 14.2 shall be conducted with each single component fault that is likely to occur in the battery protection circuit and which would result in overcharging of the built-in battery.		P
Exception	Protective devices determined to be reliable, may remain in the circuit without being faulted.		P
14.5	For lithium chemistries, one of the above test samples in 14.3 shall be evaluated with the following additional conditions in place. The built-in battery is to be subjected to a constant charging maximum current I_c , specified by the manufacturer at the input point of 14.2 with a supply voltage 1.1 times the upper limit charging voltage for single cell/cell block batteries or 1.1 times the upper limit charging voltage per cell for series connected multi-cell batteries. No need to apply the single fault condition on BMS. The temperature on the cell casing and the charging voltage for the cell/cell block shall be monitored. The test is to continue until the cell or battery explodes, vents, or BMS operates, and the temperature of the internal cell casing reaches steady state conditions or returns to ambient.		P
14.6	At least one of the five samples shall be subjected to the test outlined in 14.3 and 14.4 with a constant current charge 5 times the C5 amp rate (e.g. at the C rate) with a supply voltage sufficient to maintain that rate throughout the duration of the test.		P
14.7	During the test, the temperature of the cell casings shall not exceed 90 ± 1 °C (194 ± 2 °F) for lithium chemistries.		P
14.8	The samples shall not explode or catch fire. For the sample tested by 14.5, the charging voltage of the cell shall not exceed its upper limit charging voltage of the operation region.		P
15	Forced-Discharge of the Cells Test		N/A

UL 2056:2025			
Clause	Requirement + Test	Result - Remark	Verdict
15.1	This test is intended for Portable Charger s with cells in multicell series applications cells that are to be used in multicell applications. The Portable Charger s are to be tested in an ambient temperature of 20 ± 5 °C (68 ± 9 °F).		N/A
15.2	For multi-cell series configurations without parallel strings a fully discharged cell is to be force-discharged by connecting it in series with fully charged cells of the same kind. The number of fully charged cells to be connected in series with the discharged cell is to equal the total number of cells in the pack less one.		N/A
15.3	For multi-cell series configurations with parallel strings, a fully discharged parallel string is to be force-discharged by connecting it in series with fully charged cells of the same kind. The number of fully charged cells to be connected in series with the discharged parallel string is to equal the total number of cells in the pack less the number of cells in the discharged parallel string. See Figure 15.1.		N/A
15.4	Each of the five Portable Charger s shall be prepared as described in 15.2 or 15.3, as applicable.		N/A
15.5	Once the fully discharged cells (or string of cells) are connected in series with the specified number of fully charged cells, the resultant battery is to be short circuited.		N/A
15.6	The positive and negative terminals of the sample are to be connected with a copper wire with a resistance load of 80 ± 20 mΩ. The Portable Charger is to discharge until a fire or explosion is obtained, or until it has reached a completely discharged state and the cell case temperature has returned to ± 10 °C (± 18 °F) of ambient temperature.		N/A
15.7	During the tests, Portable Charger s supplied with protective devices shall be subjected to a single component fault using any single fault condition which is likely to occur in the discharge circuit and which would result in excessive discharge of the battery.		N/A
Exception	A positive temperature coefficient device which complies with the applicable tests specified in UL 1434 and UL 60730-1 or CSA C22.2 E60730-1, or other protective devices determined to be reliable, may remain in the circuit without being faulted. Other standards that may apply are UL 248-14 / CSA C22.2 No. 248.14 and UL 60691 or CSA C22.2 No. 60691.		N/A
15.8	The samples shall not explode or catch fire.		N/A

UL 2056:2025			
Clause	Requirement + Test	Result - Remark	Verdict
16	Temperature Test and BMS Verification		P
16.1	A Portable Charger shall be subjected to a normal temperature test under both input (charging) and output (discharging) conditions. As a result of this testing, temperatures on temperature sensitive components shall not exceed the limits outlined in Table 16.1 and Table 16.2.		P
16.2	For the output loading temperature test, a fully charged Portable Charger shall be subjected to a constant resistive loading across the output ports of the Portable Charger, at the maximum rated current of the output ports. Temperatures and cell voltages are monitored until thermal stabilization or until the built-in battery is at its rated end-of-discharge voltage, whichever comes first.		P
16.3	For the input loading temperature test, a fully discharged Portable Charger shall be subjected to charging at maximum current as specified by the manufacturer. Temperatures and cell voltages are monitored until thermal stabilization or until the built-in battery is at its fully charged state, whichever comes first.		P
16.4	Temperatures are considered to be stabilized when three successive readings taken at intervals of 10 % of the previously elapsed duration of the test, but not less than 15 min, indicate no further increase.		P
16.5	Protective devices within the pack shall not operate during the test.		P
16.6	Temperatures are monitored on surfaces of components using thermocouples. Thermocouples are to consist of 0.05 mm ² (30 AWG) wires. Larger size wires may be used, but they shall not exceed 0.21 mm ² (24 AWG) and shall not be large enough to result in a heat sink condition on the part under test.		N/A
16.7	<p>During the normal temperature test, temperature measurement T shall not exceed: $(T_{max} + T_{amb} - T_{ma})$</p> <p>where:</p> <p>T is the temperature of the given part measured under the prescribed test,</p> <p>T_{max} is the maximum temperature specified for compliance with the test,</p> <p>T_{amb} is the ambient temperature during the test,</p> <p>T_{ma} is the maximum ambient temperature permitted by the manufacturer's specification, or 25 °C (77 °F), whichever is</p>		P

UL 2056:2025			
Clause	Requirement + Test	Result - Remark	Verdict
	greater. During the test T_{amb} should not exceed T_{ma} unless agreed by all parties involved.		
16.8	During the normal temperature test, cell voltages shall not be below the end-of-discharge voltage of the operation region in the output loading temperature test, and the cell voltages shall not exceed the upper limit charging voltage of the operation region in the input loading temperature test.		P
17	Power Input Test		P
17.1	The current input to a Portable Charger shall not exceed 110 % of the marked input current rating of the Portable Charger , when the Portable Charger is operated under the conditions of maximum normal load.		P
17.2	Maximum normal load shall consist of the maximum power draw while the Portable Charger is operating in all possible modes including the battery at different states of charge. This may include charging the built-in battery, output ports unloaded or loaded at the rated maximum normal load and the operation of auxiliary functions such as flashlight, speaker, etc. Any load that can be operated at the same time shall be considered in order to obtain the maximum normal load.		P
18	Overload of Output Ports Test		P
18.1	Each power output pin of output port shall be overloaded in accordance with 18.2 – 18.5.		P
18.2	In accordance with manufacturer's specifications, fully charge the built-in battery of Portable Charger .		P
18.3	The Portable Charger is covered with one layer of cheesecloth and placed on a softwood board covered with one layer of tissue paper.		P
18.4	Each power output pin of output port shall then be loaded to draw the maximum power, for 1 h or the maximum duration of operation permitted by the battery pack, whichever is less. For Portable Charger s which enable their output(s) while the input power is applied, the input terminals are to be subjected to the maximum charging rate at the same time during this test.		P
18.5	During the test, the samples shall not vent, explode, or catch fire. After this test, the cheesecloth and tissue paper shall remain	No leakage or explosion occurred	P

UL 2056:2025			
Clause	Requirement + Test	Result - Remark	Verdict
	intact (e.g. no discoloration or minor charring). The cell casing temperature shall not exceed the manufacturer's recommended maximum temperature.	with the sample. Keep gauze and tissues intact	
19	Flammability of Photovoltaic Cells Test		N/A
19.1	This test shall be conducted if the Portable Charger is provided with integral photovoltaic cells as a power source.		N/A
19.2	In accordance with manufacturer's specifications, fully charge the built-in battery of the Portable Charger .		N/A
19.3	The Portable Charger is covered with one layer of cheesecloth and placed on a softwood board covered with one layer of tissue paper.		N/A
19.4	The Portable Charger is subjected to single component fault that is likely to occur and which would result in flammability issue of the photovoltaic cells, such as back-feed of battery power, and is kept in this state for 1 h.		N/A
19.5	During this test, the battery shall not vent, explode, or catch fire. After this test, the cheesecloth and tissue paper shall remain intact (e.g. no discoloration or minor charring).		N/A
20	Capacity Verification Test		P
20.1	The marked electrical capacity of Portable Charger , measured at the power output pin of output port, shall comply with IEC 61960-3, Clause 7.3.1, Discharge Performance at 20 °C (Rated Capacity) for lithium cell Portable Charger or IEC 61951-2, Clause 7.3.2.3, Discharge performance for batteries at rated capacity (20 °C) for nickel cell Portable Charger , and the modified test method in 20.2.		P
20.2	The Portable Charger is discharged at a constant current equal to rated current of the output port, until its voltage is equal to the end-of-discharge voltage of the output port, specified by the manufacturer.		P
ENCLOSURE TESTS			
21	General		N/A
21.1	The Portable Charger s are to be tested in an ambient		N/A

UL 2056:2025			
Clause	Requirement + Test	Result - Remark	Verdict
	temperature of $20 \pm 5 \text{ }^{\circ}\text{C}$ ($68 \pm 9 \text{ }^{\circ}\text{F}$).		
21.2	Portable Charger s with outer plastic enclosures shall be subjected to the tests described in Sections 22, 23, 24, and 25. Portable Charger s with outer enclosures made from materials other than plastic, shall be subjected to the tests described in Sections 22, 23, and 25.		N/A
22	Steady Uniform Force Test		P
22.1	The Portable Charger s are to be tested in an ambient temperature of $20 \pm 5 \text{ }^{\circ}\text{C}$ ($68 \pm 9 \text{ }^{\circ}\text{F}$).		P
22.2	The built-in battery of the Portable Charger shall be fully charged in accordance with the manufacturer's specifications.		P
	External enclosures of the Portable Charger are to be subjected to a steady force at a rate of $10 \pm 2.5 \text{ N/s}$ ($2.25 \pm 0.56 \text{ lbf/s}$) up to $250 \pm 10 \text{ N}$ ($56 \pm 2 \text{ lbf}$) and held for a period of 30 s, applied in turn to the top, bottom and sides of the Portable Charger enclosure by means of a suitable test tool providing contact over a circular plane surface 30 mm (1.2 inch) in diameter. For cylindrical Portable Charger s, using external means to secure the product from rolling to allow the sides to be tested would be acceptable. Each side of a cylindrical Portable Charger would be 90° rotation along the longitudinal axis.		P
	The samples shall not explode or catch fire. The outer enclosure shall not crack to the extent that the cells or any protective devices are exposed.		P
	The enclosure shall not separate as a result of the application of the steady force in accordance with 22.3.		P
	The sample shall be examined 6 h after testing and shall not vent, flame, explode, or leak as described in 7.2.		P
23	Flexing Force Test		P
23.1	Two Portable Charger s are to be tested in an ambient temperature of $20 \pm 5 \text{ }^{\circ}\text{C}$ ($68 \pm 9 \text{ }^{\circ}\text{F}$).		P
23.2	Each sample is to be tested in accordance with 23.3 – 23.6. The second sample shall be tested rotated 180° about its longitudinal axis from the orientation of the first sample.		P

UL 2056:2025			
Clause	Requirement + Test	Result - Remark	Verdict
Exception	Portable Charger s with all external dimensions greater than 40 mm (1.6 inch) do not apply.		N/A
23.3	The built-in battery of the Portable Charger shall be fully charged in accordance with manufacturer's specifications.		P
23.4	The test shall be set up as shown in Figure 23.1 using a suitable test tool providing contact with the center rod through a flat plate with a circular plane surface 30 mm (1.2 inch) in diameter.		P
	The Portable Charger shall be placed with its longitudinal axis perpendicular to the 3.175 mm (1/8-inch) metal rods placed at opposite ends of the Portable Charger , with the center of each rod not more than 6.35 mm (1/4 inch) from the edge of the enclosure. A 12.7 mm (1/2-inch) metal rod shall be placed on top of the Portable Charger at the center of the longitudinal axis. The length of the metal rods shall be at least longer than the short axis of the Portable Charger enclosure.		P
	A linear force shall be applied to the center rod at a steady rate at 10 N/s \pm 2.5 N (2.25 \pm 0.56 lbf) up to 250 \pm 10 N (56 \pm 2 lbf) and held for a period of 5 s.		P
	The samples shall not explode or catch fire during the test. The outer enclosure is permitted to crack to the extent that the cells or any protective devices are not exposed. Openings in the enclosure created as a result of the application of the 250 N (56 lbf) flexing force shall meet the criteria of 6.1.7.		P
	The sample shall be examined 6 h after testing and shall not vent, flame, explode, or leak as described in 7.2.		P
24	Mold Stress Relief Test		P
24.1	Each of three samples is to be placed in a full-draft circulating-air oven maintained at a uniform temperature of 70 \pm 1 $^{\circ}$ C (158 \pm 2 $^{\circ}$ F). The samples are to remain in the oven for 7 h.		P
Exception	If the maximum temperature, T, recorded on the battery pack thermoplastic enclosure parts, obtained during the normal temperature test of Section 16 exceeds 60 $^{\circ}$ C (140 $^{\circ}$ F), then the oven temperature is to be maintained at a temperature equal to T + 10 $^{\circ}$ C (50 $^{\circ}$ F).		P
24.2	To prevent hazards from overheating energized cells, samples shall either be fully discharged prior to conditioning or provided		P

UL 2056:2025			
Clause	Requirement + Test	Result - Remark	Verdict
	with "dummy" cells, which are representative of the actual cells.		
24.3	After careful removal from the oven and after returning to room temperature following the conditioning described in 24.1, the samples shall show no evidence of mechanical damage that would result in damage to cells or protective circuitry. In addition, the enclosures shall not crack, warp, or melt to the extent that the cells or any protective devices are exposed. Openings in the enclosure created as a result of the conditioning shall meet the criteria of 6.1.7.		P
25	Drop Impact Test		P
25.1	The Portable Charger s are to be tested in an ambient temperature of 20 ±5 °C (68 ±9 °F).		P
Exception	Portable Charger s employing plastic enclosures that are intended for use in cold environment temperatures less than 5 °C (41 °F), the sample shall be conditioned for 3 h at 0 °C (32 °F) (or the minimum temperature specified by the manufacturer) prior to conducting the drop test, which shall be conducted immediately after removing the samples from the cold conditioning.		P
25.2	The built-in battery of the Portable Charger shall be fully charged in accordance with manufacturer's specifications.		P
25.3	Each of three samples is to be dropped from a height of 1 m (3.28 ft) so it strikes a concrete surface in the position that is most likely to produce the adverse results in 25.4. Each sample is to be dropped three times in unique orientations.		P
25.4	The samples shall not vent, explode, or catch fire.		P
25.5	The sample shall be examined 6 h after testing and shall not vent or leak as described in 7.2, and the integrity of the protective devices shall be maintained.		P
25.6	The outer enclosure and any covers relied on for compliance to this Standard shall not crack. Any covers relied on for compliance to this Standard shall not separate or become detached.		P
26	Label Permanence Test		N/A
26.1	The purpose of this test is to evaluate the permanence of an adhesive label that has not been subjected to a previous evaluation program. See 27.1.		N/A

UL 2056:2025			
Clause	Requirement + Test	Result - Remark	Verdict
26.2	<p>An adhesive label secured to a surface representative of the end use application and is subjected to the following conditioning:</p> <p>a) The label sample is rubbed by hand for 15 s with a piece of cloth soaked with water; and</p> <p>b) The sample is again rubbed for 15 s with a piece of cloth soaked with petroleum spirit.</p>		N/A
26.3	<p>The petroleum spirit to be used for the test is an aliphatic solvent hexane having:</p> <p>a) A maximum aromatics content of 0.1 % by volume;</p> <p>b) A kauributenol value of 29;</p> <p>c) An initial boiling point of approximately 65 °C (149 °F);</p> <p>d) A dry point of approximately 69 °C (156.2 °F); and</p> <p>e) A mass per unit volume of approximately 0.7 kg/L.</p>		N/A
	<p>Exception: As an alternative, it is permitted to use a reagent grade hexane with a minimum of 85 % as nhexane.</p>		N/A
26.4	<p>After the conditioning outlined in 26.2, the sample is to be examined for signs of damage including curing and to determine if the marking is still legible. The sample is also examined to determine if it can be removed easily by hand from the surface.</p>		N/A
26.5	<p>As a result of the conditioning, the sample label shall remain legible, show no evidence of damage including curling and shall not be able to be able to be easily removed by hand from the adhered surface.</p>		N/A
MARKINGS			
27	General		N/A
27.1	<p>The markings required for compliance with this Standard shall be legible and permanent such as etched, adhesive labels, etc. An adhesive-backed label shall comply with the requirements in UL 969 or CSA C22.2 No. 0.15, for the intended exposure conditions and surface adhered to.</p>		N/A
Exception	<p>Adhesive labels may be alternately evaluated to the Label Permanence Test in Section 26.</p>		N/A

UL 2056:2025			
Clause	Requirement + Test	Result - Remark	Verdict
27.2	<p>A Portable Charger shall be legibly and permanently marked with:</p> <p>a) The manufacturer's name, trade name, or trademark or other descriptive marking by which the organization responsible for the product may be identified;</p> <p>b) A distinctive ("catalog" or "model") number or the equivalent;</p> <p>c) Input rating in Vdc or Vac with frequency, and A. If there is more than one input port, the rating of each port shall be provided. Symbol IEC 60417-5032 can be used for ac and symbol IEC 60417-5031 can be used for dc;</p> <p>d) Output rating in Vdc and A. If there is more than one output port, the rating of each port and the combined rating (if it is not equal to the summation of all ports) shall be provided;</p> <p>e) Electrical capacity in Ah or mAh. If there is more than one output port/output rating, either the capacity of each port/rating shall be provided, or the minimum capacity of these ports/ratings shall be provided;</p> <p>f) Electrical capacity in Wh of the built-in battery;</p> <p>g) The date or other dating period of manufacture not exceeding any three consecutive months; and</p> <p>h) The chemistry type of the Portable Charger .</p>		N/A
Exception No. 1	The manufacturer's identification may be in a traceable code if the product is identified by the brand or trademark owned by a private labeler.		N/A
Exception No. 2	<p>The date of manufacture may be abbreviated; or may be in a nationally accepted conventional code or in a code affirmed by the manufacturer, provided that the code:</p> <p>a) Does not repeat in less than 10 years; and</p> <p>b) Does not require reference to the production records of the manufacturer to determine when the product was manufactured.</p>		N/A
27.3	When a manufacturer produces the Portable Charger at more than one factory, each Portable Charger shall have a distinctive marking to identify it as the product of a particular factory.		N/A
27.4	<p>The following or equivalent wording shall be permanently and legibly marked on the Portable Charger :</p> <p>“CAUTION: Risk of Fire and Burns. Do Not Open, Crush, Heat Above (manufacturer’s specified maximum</p>		N/A

UL 2056:2025			
Clause	Requirement + Test	Result - Remark	Verdict
	temperature) or Incinerate. Follow Manufacturer's Instructions." This wording or equivalent shall also be included in the instructions supplied with the Portable Charger .		
27.5	The markings shall be of contrasting colors or light versus dark of the enclosure, such that contrasting colors are those that sit opposite each other on the color wheel. Examples of contrasting color pairs are: Black and White, Red and Green, Blue and Orange, Yellow and Purple.		
INSTRUCTIONS			
28	General		N/A
28.1	Portable Charger s shall be provided with legible instructions pertaining to a risk of fire or injury to persons associated with the use of the product.		N/A
28.2	An illustration is allowed with a required instruction to clarify the intent but shall not replace the written instruction.		N/A
	The following instructions shall be provided with the Portable Charger in the form of a manual, stuffer sheet or on packaging. The instructions may additionally be repeated via markings provided directly on the Portable Charger : a) Instructions for operating and charging the Portable Charger , including the operating temperature range and charging temperature range for the Portable Charger ; and b) Instructions for storing and disposing of the Portable Charger , including the storage temperature range for the Portable Charger .		
29	Instructions Pertaining to Risk of Fire or Injury to Persons		P
29.1	Instructions pertaining to a risk of fire or injury to persons shall warn the user of reasonably foreseeable risks and state the precautions to be taken to reduce such risks. Such instructions shall be preceded by the heading "INSTRUCTIONS PERTAINING TO RISK OF FIRE OR INJURY TO PERSONS" or the equivalent.		P
29.2	Unless otherwise indicated, the text of the instructions in 29.4 shall be in the words specified or words that are equivalent, clear, and understandable. Substitution of the signal word "DANGER" for "WARNING" is allowed when the risk associated with the product is such that a situation exists which, if not avoided, will result in death or serious injury.		P

UL 2056:2025			
Clause	Requirement + Test	Result - Remark	Verdict
29.3	Numbering of the items in the list in 29.4 and including other instructions pertaining to a risk of fire or injury to persons that the manufacturer determines to be necessary and that do not conflict with the intent of the instructions are acceptable.		P
29.4	The instructions pertaining to a risk of fire or injury to persons shall include those items in the following list that are applicable to the product. The statement "IMPORTANT SAFETY INSTRUCTIONS" or the equivalent shall precede the list, and the statement "SAVE THESE INSTRUCTIONS" or the equivalent shall either precede or follow the list. The word "WARNING" shall be entirely in upper case letters or shall be emphasized to distinguish it from the rest of the text.		P

18	TABLE: Overload of Output Ports Test					P
Sample No.	OCV before test (Vdc)	Test time	Loaded Current (A)	Maximum case temperature (°C)	Results	
B24	4.74	1h	3.92	44.5	P	
Supplementary information: No vent, explode, or catch fire. After this test, the cheesecloth and tissue paper shall remain intact.						

19	TABLE: Flammability of Photovoltaic Cells Test			N/A
Sample No.	OCV before test (Vdc)	Single fault condition	Vent, explode, or catch fire?	
--	--	--	Yes / No	
Supplementary information: After this test, the cheesecloth and tissue paper remain intact. S-C=short-circuit.				

20	TABLE: Capacity Verification Test					P
Sample No.	Cycle No.	OCV before test (Vdc)	Discharged Current (A)	Measured Capacity (mAh)	Results	
B25	1	5.16	3.0	4853.6	P	
	2	5.17	3.0	4659.5	P	
	3	5.16	3.0	4526.6	P	
	4	5.15	3.0	4626.5	P	
	5	5.16	3.0	4626.7	P	
Supplementary information:						
The capacity of Portable Charger is not less than 100% of the marked capacity rating.						

22	TABLE: Steady Uniform Force Test			P
Ambient temperature: 24.8°C				
Sample No.	B26	B27	B28	
Mass before test (g)	139.053	138.780	139.814	
Mass after test (g)	139.053	138.780	139.814	
Mass loss ratio (%)	0.000	0.000	0.000	
Supplementary information:				
No explode or fire, no vent, flame or leak after 6h of testing.				

23	TABLE: Flexing Force Test		P
Ambient temperature: 24.0°C			
Sample No.	B29	B30	
Mass before test (g)	139.716	139.582	
Mass after test (g)	139.716	139.582	
Mass loss ratio (%)	0.000	0.000	
Supplementary information:			
No explode or fire, no vent, flame or leak after 6h of testing.			

24	TABLE: Mold Stress Relief Test			P
Ambient temperature: 24.4°C				
Sample No.	B31	B32	B33	
Mass before test (g)	139.553	139.715	138.886	
Mass after test (g)	139.536	139.691	138.869	
Mass loss ratio (%)	0.012	0.017	0.012	
Supplementary information:				
No evidence of mechanical damage that would result in damage to cell or protective circuitry after test.				

25	TABLE: Drop Impact Test			P
Ambient temperature: 24.7°C				
Sample No.	B34	B35	B36	
Mass before test (g)	139.006	138.981	138.527	
Mass after test (g)	139.006	138.981	138.527	
Mass loss ratio (%)	0.000	0.000	0.000	
Supplementary information:				
No explode or fire, no vent, flame or leak after 6h of testing.
